

QuantumPlex™ Beads Provide the Ideal Platform for a Variety of Multiplexing Applications

**AACC OEM Lecture
August 2001**

Nathan Foushee

What is Multiplexing?

Multiplexing is the ability to simultaneously:

- Test multiple samples
- Detect multiple analytes in a given sample

Current Multiplexing Applications

- Cell signaling (cytokines)
- Viral screening
- Autoimmunity assays
- Allergen testing
- Genomics
- Pharmaceutical trials
- Blood typing / banking
- Molecular diagnostics

QuantumPlex™ Overview

- 5-bead set
- 4.4µm or 5.5µm beads
- Internally dyed with Bangs' Starfire Red™ fluorescent dye
- May be acquired / analyzed on any standard cytometer
- Goat anti-Mouse (GAM), Streptavidin, or Carboxylated surface

SEM of 5.5µm QuantumPlex

Starfire Red™ Dye

- Excited with any common laser (350, 488, 633nm)
- Emits far red (685-690nm)
- Very little carry-over into other fluorescent channels
- Low signal in FL1, FL2 allows use of common Fluorescein and Phycoerythrin antibodies for analyte detection

Benefits of QuantumPlexing

Using one 5-bead set, and reporter antibodies fluorescent in only one channel, you may:

- Simultaneously test 5 samples for a single analyte
- Simultaneously test one sample for up to 5 analytes

Using two 5-bead sets, or reporter antibodies fluorescent in different channels, increases the number of analytes you may test for by two-fold.

16

Benefits of QuantumPlexing

- Reduced cost (supplies, reagents, labor)
- Reduced time
- Ability to quickly and accurately compare samples
